

Backend junior to mid-level interview task

- Clean Laravel installation using CLI.
- Company model with the migration and resource controller, index, create, store, edit, update, and delete.
 - Use resource routes.
 - Each company will have name, address, logo (image field) field.
 - Store the logo field within the storage folder.
 - Company will have employees.
- Employee model with the migration and resource controller, index, create, store, edit, update, and delete.
 - Use resource routes.
 - Each employee will have name, email, password, company, image.
 - Store the image field within storage folder.
 - Employee can only belong to one company at a time.

Use yajra datatable package to list either companies and employees with ajax.

Within the employee model show a dropdown list of all companies to filter employees according to specific company.

Once the employee created, create an event to send a welcome email to the newly added employee.

The above task should take up to 1 to an 1.5 hours, on finishing the task create a new repo to upload your work then share it via email, try to use a clean well structured Laravel MVC pattern.

Thanks.
